

PREDICTING THE CHOICES

PROBLEM STATEMENT

- University of Texas is to launch some new programs and want to know about their target audience, they are willing to know what kind of programs would target the audience (picked up by the students)
- They aimed to properly analyze and predict the type of programs(Academic or Vocational) picked by the students based upon their academic data.
- The model built helps to predict the outcome(i.e which kind of programs) that can be chosen by the audience based upon the data of their academic aspects.

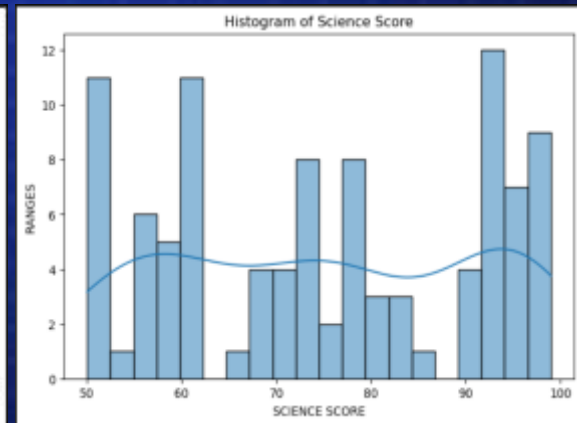

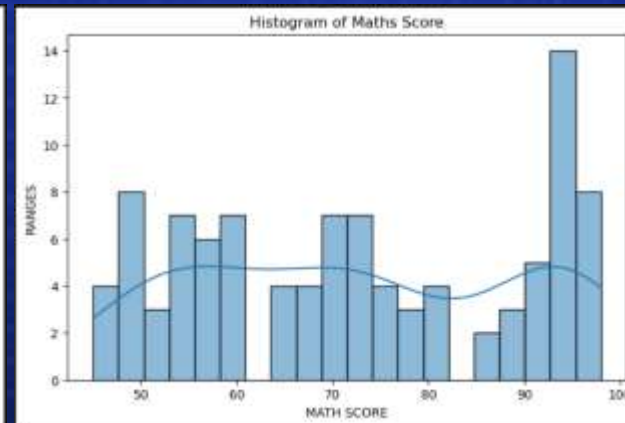

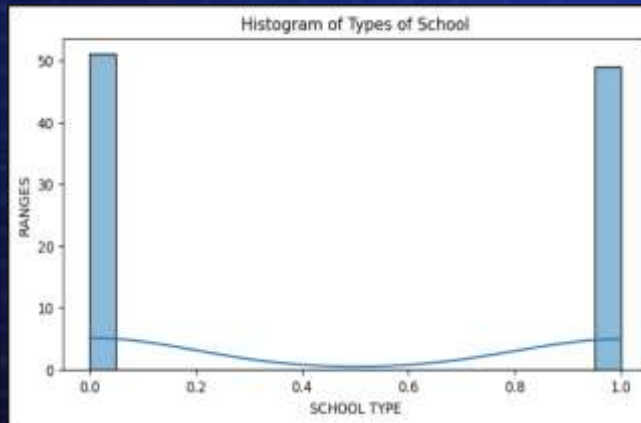

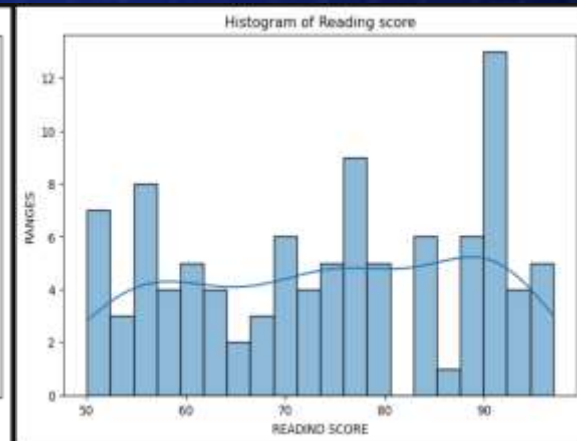

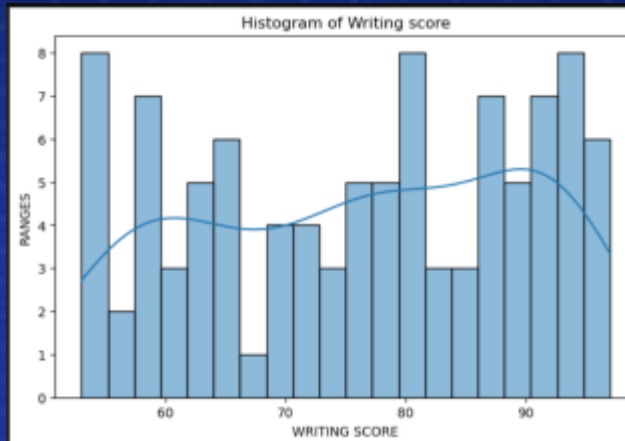

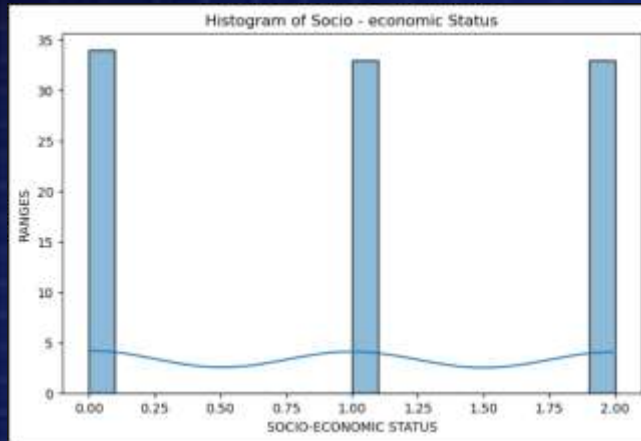

INTRODUCTION

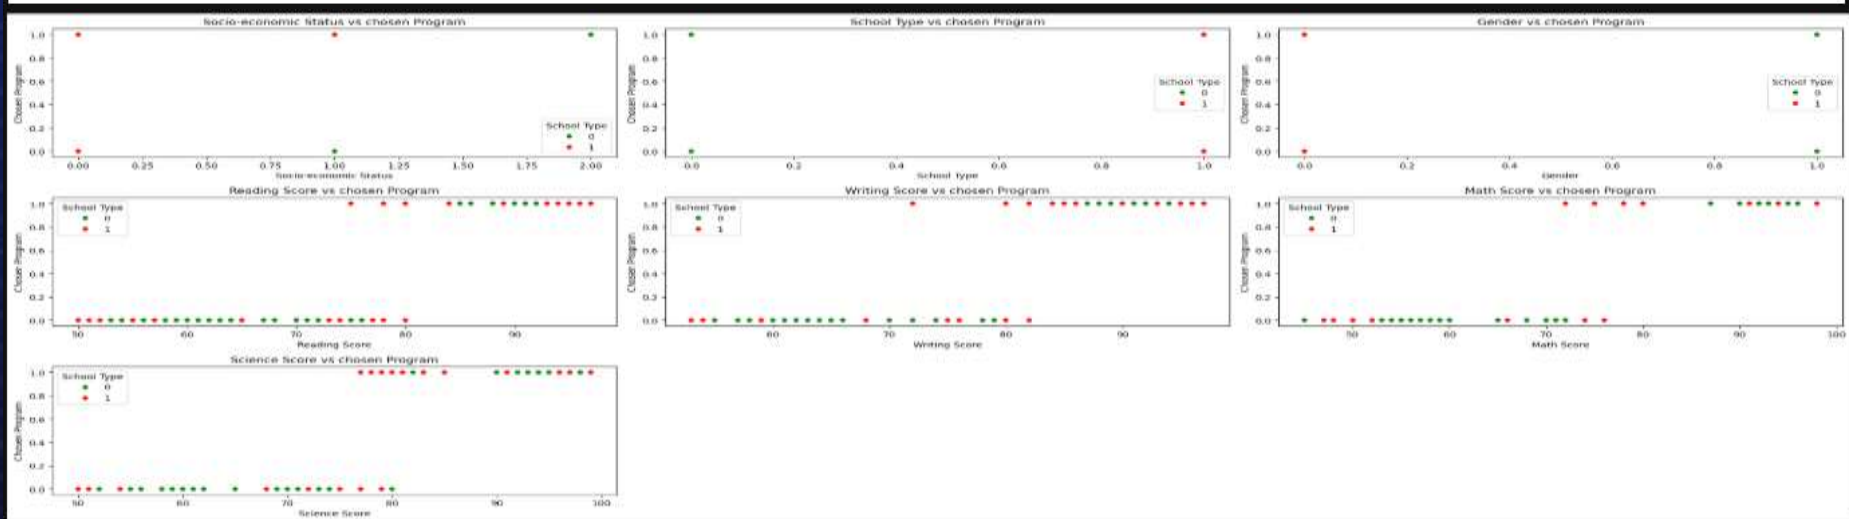

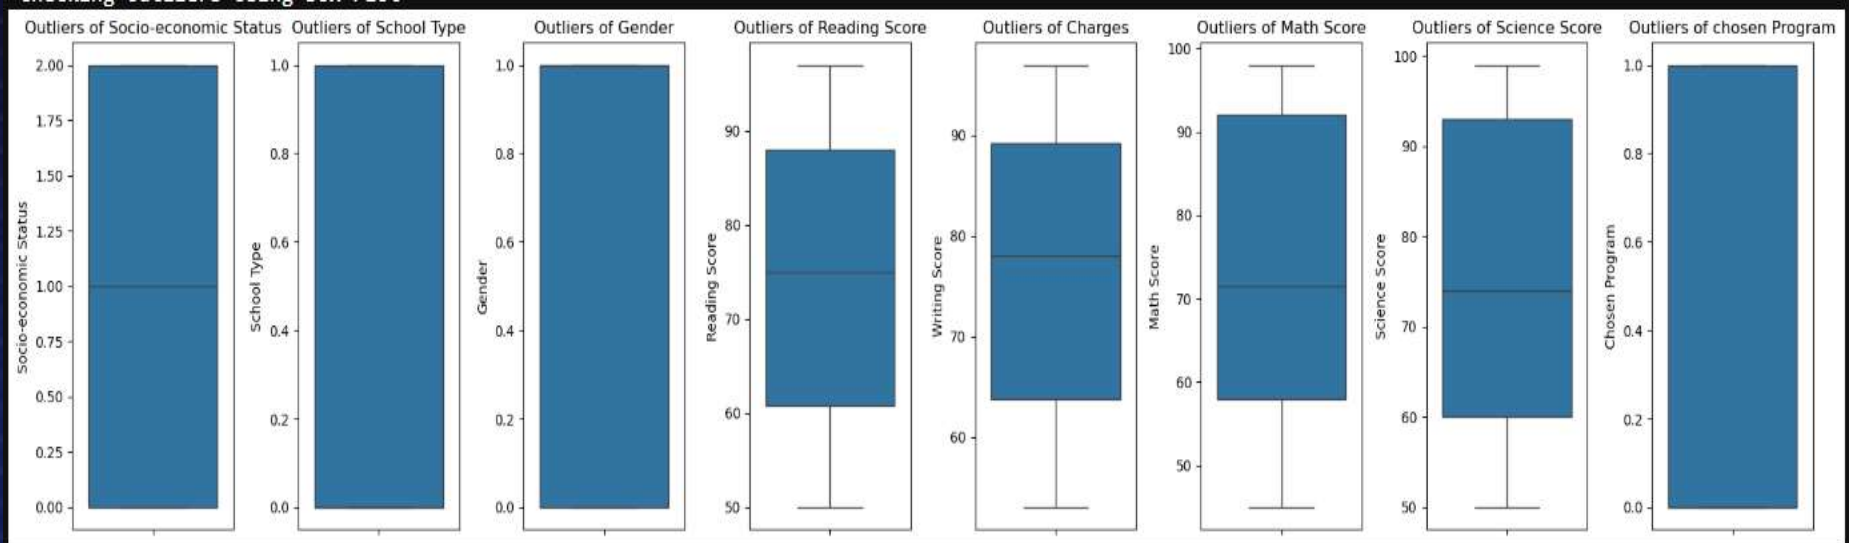

- In this project, I aim to build a model that can predict the choices of students based upon their academic data .
- This model predicts the outcome of what type of programs would be chosen more by the students.
- In this project, I have analysed the data given and visualized them for better understanding of the data and build an appropriate model that can predict outcomes.

WORKING DONE

- The Academic data was collected and preprocessed to analyzed.
- The data analyzed was visualized in histograms by using libraries.
- Checked for outliers and missing values using the interquartile method and visualized them using box and scatter plots.
- By using the Linear Regression algorithm we build the model for prediction.

RESULT OBTAINED

- The model built predicted the outcome as vocational

Mean Squared Error: 0.05667172499059301

R-squared: 0.7710233333713414

Accuracy: 0.9

Classification Report:

	precision	recall	f1-score	support
0	0.91	0.91	0.91	11
1	0.89	0.89	0.89	9
accuracy			0.90	20
macro avg	0.90	0.90	0.90	20
weighted avg	0.90	0.90	0.90	20

Predicted Program: Vocational
